OBJECTIVE

Engineering student pivoting into enterprise sales, with a strong technical foundation in cloud infrastructure and AI-adjacent tooling. Comfortable explaining complex products in simple terms, self-directed in owning projects end-to-end, and drawn to the fast-paced, outcome-driven nature of early-stage B2B SaaS sales. Excited to help Masal AI take its voice-calling product to real estate developers and brokers.

CORE STRENGTHS FOR THIS ROLE

- **Technical product fluency** — can speak credibly about how an AI product actually works (APIs, automation, real-time dashboards), which builds trust faster with prospects evaluating an AI tool
- **Ownership & follow-through** — history of independently driving projects from idea to deployment without being managed step-by-step
- **Communication & teaching** — experience explaining technical concepts to non-technical audiences
- **Fast, self-directed learner** — repeatedly picked up new tools and certifications independently and applied them quickly
- **Comfort with data & reporting** — built dashboards and tracked metrics; quick to pick up CRM and pipeline reporting

EXPERIENCE

Intern — India Space Lab

- Built and maintained the organization's public-facing website, effectively acting as the team's front door for outside visitors and members — early exposure to representing an organization externally
- Designed and delivered Python tutorials for a national space club, translating technical concepts into clear, accessible language for learners with no coding background — direct practice in the communication skills a sales demo requires

TECHNICAL PROJECTS — Product & Sales-Relevant Credibility

Selected, independently-owned projects that build the technical fluency needed to sell an AI voice-calling product with confidence — understanding uptime, automation, and the metrics/dashboards Masal AI uses to prove ROI to customers (call recordings, transcripts, booking counts).

Automated Cloud Application & Observability Stack

- Built and deployed a live application end-to-end, then built real-time dashboards (Prometheus + Grafana) to track its performance — the same “prove it's working” reporting a prospect expects from an AI product
- Owned the entire pipeline solo, from infrastructure to deployment automation — mirroring the self-directed ownership this role requires

Production Kubernetes Reliability & Observability Platform

- Deployed a live service and built dashboards for request volume and response latency, then used that data to diagnose issues — practical experience turning raw metrics into a clear story, a core sales-demo skill

CERTIFICATIONS

- AWS Cloud Practitioner Certified — June 2026
- eJPTv2 Certified — Feb 2026
- The Bits and Bytes of Networking — Google (Coursera)

EDUCATION

VIT Bhopal University — B.Tech, Computer Science and Engineering, CGPA: 8.36

Aug 2023 – 2027
